Ingestion:	May cause irritation
Inhalation:	May cause lung damage or respiratory damage through repeated or prolonged exposure.

Silica is the chief cause of pulmonary dust disease. The prolonged inhalation of dusts containing free silica may result in the development of disabling, pulmonary fibrosis known as silicosis. The action of crystalline silica on the lungs results in the production of a diffuse, nodular fibrosis in which the parenchyma and the lymphatic systems are involved. This fibrosis is, to a certain extent, progressive, and may continue to increase for several years after exposure is terminated. The first and most common symptom is shortness of breath. Further progress of the disease results in marked fatigue, extreme dyspnea and cyanosis, loss of appetite, pleuritic pain and total incapacity to work. If tuberculosis does not supervene, the condition may eventually cause death either from cardiac failure or from destruction of lung tissue, with resultant anoxemia.
